

Symmetry Energy and Equations of States for Nuclear Matter

Myung-Ki Cheoun

Soongsil University, Seoul, Korea

Heavy Ion Meeting (HIM), Korea University, May 24, 2013

Contents

1. Symmetry energy in Equations of state (EoSs)

2. Symmetry Energy and Pairing Correlations

3. GMR and PDR(GDR) in Finite Nuclei and Symmetry Energy

4. Symmetry Energy and Eq. of States above saturation density for Nuclear Matter from Heavy Ion Scattering

5. EoSs for Compact Cosmological Objects

6. PV electron scattering, Neutrino scattering and Sym. Energy

7. An application of Sym. Energy and EoSs in N-Astrophysics

8. Summary

2013-05-24

HIM Meeting, Korea University, May
24, 2013

Science program with tentative beam schedule

Beam schedule	Science program	Exp. facility [#]	Beam species on exp. target		Beam Intensity on exp. target (pps) (required/expected)
			Day1 [†]	Extra 2 Years	
2017.June.1 ~ from SCL1 (<18.5 MeV/u)	Nuclear structure SHE search, rp-process, Spin physics	RS	⁵⁸ Fe	⁶⁴ Ni ^{26m} Al (²⁸ Si), ²⁵ Al (²⁸ Si), ⁴⁴ Ti (⁴² Ca), ^{14,15} O (¹⁵ N)	¹⁵ N, ⁵⁸ Fe (<10 ⁹⁻¹⁰) ²⁸ Si, ⁴² Ca, ⁶⁴ Ni (<10 ⁷) ²⁵ Al, ^{26m} Al, ⁴⁴ Ti, ^{14,15} O: (10 ⁵⁻⁶)
	Pigmy dipole resonance	LAS-L	⁵⁸ Ni	⁴⁰ Ca, ¹¹² Sn	(10 ⁶⁻⁸ / <10 ⁹⁻¹⁰)
	Biological effects	BM	¹² C		(<10 ¹² / >10 ¹²)
2017.July.1 ~ from ISOL (~5 keV/u)	Fine structure, mass measurement	AT/LS	¹³² Sn	¹³⁰⁻¹³⁵ Sn	¹³² Sn (<10 ⁵ / 10 ⁷)
2018.Jan.1 ~ ISOL-SCL3 (<18.5 MeV/u)	r-process	RS	¹³² Sn	¹³⁰⁻¹³⁵ Sn	¹³² Sn (10 ⁶ / 10 ⁷), ¹³⁰⁻¹³⁵ Sn (10 ³⁻⁶ / 10 ³⁻⁷)
	Pigmy dipole resonance	LAS-L	¹³² Sn	⁶⁰⁺ⁿ Ni, ¹³⁰⁻¹³⁵ Sn	^{65,66} Ni (10 ⁶⁻⁸ / 10 ⁶⁻⁷)
SCL1-SCL2 (~ hundreds MeV/u)	New materials	μSR	Muon by (p, πx) → μ		p ~full intensity, μ (10 ⁸ /10 ⁹)
	Biological effects	BM	¹² C		(<10 ¹² / >10 ¹²)
	Baseline experiments, Spin physics	LAS-H	⁴⁰ Ca	⁵⁸ Ni, ¹¹² Sn, ¹³² Xe	(10 ⁶ -10 ⁸ / <10 ⁹⁻¹¹)
SCL1-SCL2(X) (~ tens MeV/u)	New material, Polarized beam	β-NMR	⁸ Li by (d,α)	¹¹ Be	p, d ~full intensity, n (< 10 ¹² / 10 ¹²)
	Neutron cross section	NSF	n by (p,n) (d,n)		⁸ Li (10 ⁸ / 10 ⁹), ¹¹ Be (10 ⁷ / 10 ⁸)
2018.Mar.1 ~ SCL1-SCL2-IF (~ hundreds MeV/u)	Nuclear structure	ZDS & HRS	¹²⁸ Sn	¹³² Sn, ¹⁸ O	¹²⁸ Sn (10 ⁶⁻⁸ / 10 ⁷), ¹³² Sn (10 ⁶⁻⁸ / 10 ⁶) [‡]
	Symmetry energy	LAS-H	¹²⁸ Sn	¹³² Sn, ⁴⁴⁺ⁿ Ca, ⁶⁰⁺ⁿ Ni, ¹⁴⁴ Xe	
2018.Sep.1 ~ ISOL-SCL3-SCL2-IF(X) (~ hundreds MeV/u)	Nuclear structure	ZDS & HRS	¹³² Sn		¹³² Sn (10 ⁶⁻⁸ / 10 ⁷), ¹⁴⁴ Xe (10 ⁶⁻⁸ / 10 ⁶)
	Symmetry energy	LAS-H	¹³² Sn	¹⁴⁴ Xe

Incompressibility of neutron-rich matter

J. Piekarewicz^{1,*} and M. Centelles^{2,†}

$$E/A(\rho, \alpha) - M \equiv \mathcal{E}(\rho, \alpha) = \mathcal{E}_{\text{SNM}}(\rho) + \alpha^2 \mathcal{S}_2(\rho) + \alpha^4 \mathcal{S}_4(\rho) + \dots$$

$\mathcal{S}_2(\rho) \equiv \mathcal{S}(\rho)$, is known as the symmetry energy.

$$\mathcal{E}_{\text{PNM}}(\rho) \equiv \mathcal{E}(\rho, \alpha = 1) \approx \mathcal{E}_{\text{SNM}}(\rho) + \mathcal{S}(\rho).$$

Sym. Energy is given by the difference of the SNM and PNM energy !!

Sym. Energy at sat. density

Sym. (in)compressibility

$$S(\rho) = J + Lx + \frac{1}{2}K_{\text{sym}}x^2 + \frac{1}{6}Q_{\text{sym}}x^3 + \dots, \quad x \equiv \frac{(\rho - \rho_0)}{3\rho_0}$$

Sym. Pressure

$$L = \left(\frac{\partial S}{\partial x}\right)_{x=0} \quad P_0 = \frac{1}{3}\rho_0 L. \quad K_{\text{sym}} = \left(\frac{\partial^2 S}{\partial x^2}\right)_{x=0}$$

$$S(\rho) = S_0 \left(\frac{\rho}{\rho_0}\right)^\gamma = J(1 + 3x)^\gamma$$

$$L = \left(\frac{\partial S}{\partial x}\right)_{x=0} = 3J\gamma,$$

$$K_{\text{sym}} = \left(\frac{\partial^2 S}{\partial x^2}\right)_{x=0} = 9J\gamma(\gamma - 1)$$

$$P_0 = \rho_0 J\gamma.$$

intermediate-energy heavy-ion

$\gamma \sim 0.69-1.05$ Transport model simulations

$\gamma \sim 0.5 \pm 0.15$

$P_0 = 2.3 \pm 0.8 \text{ MeV/fm}^3$ and $J = 32 \pm 1.8 \text{ MeV}$

from pygmy dipole resonances

$\gamma \sim 0.5-0.65$

$23.3 < S(\rho = 0.1 \text{ fm}^{-3}) < 24.9 \text{ MeV}$

the giant dipole resonance in ^{208}Pb

Sym. Energy has still some ambiguities !!
 More refined values may be obtained from the Low Energy Reactions ? !!

E

Equation of State

- 1. Neutron Threshold
- 2. Neutron Drip
- 3. Nuclear Matter
- 4. Phase Transitions

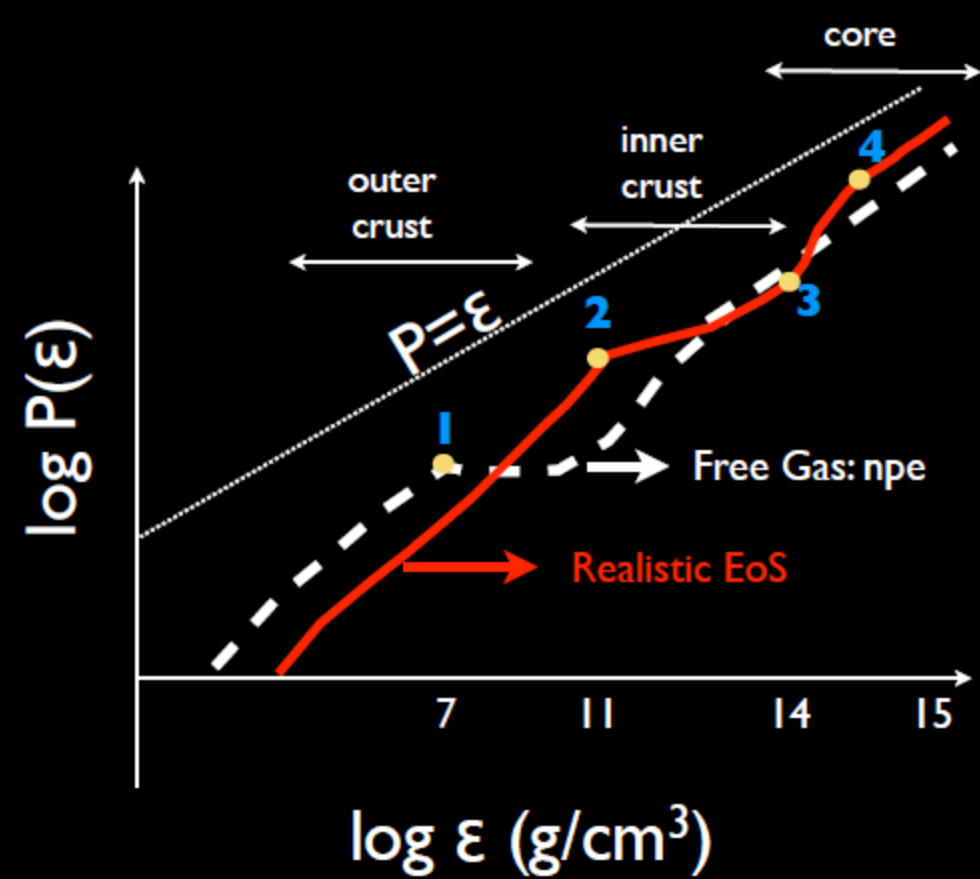

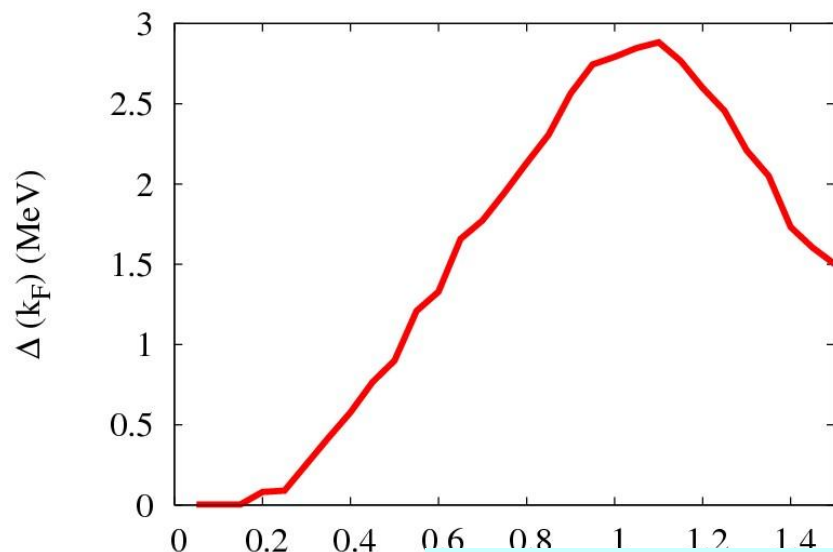

Fig. 1. Mass M of nuclei and the $\log \epsilon$ plotted versus $\log \epsilon$

Since M depends on ϵ , the EoS should be considered !!

nuclei, the

Pairing gap in symmetric matter

Pairing gap in neutron matter

**Pairing Gaps by the CD Bonn potentials are reproduced to some extent in our RMF model !!
The Urca process is in progress !!**

compressibility (K_A)

$$K_A = K_{Vol} + K_{Surf}A^{-1/3} + K_{Sym} \left(\frac{N-Z}{A} \right)^2 + K_{Coul} \frac{Z^2}{A^{4/3}} + \dots$$

★

$$\frac{K_A}{m \langle r^2 \rangle} = E_0^2 + 3 \left(\frac{\Gamma}{2.35} \right)^2$$

Figure 18 Schematic illustration of the monopole resonance in nuclei.

$$E_0 = m_1/m_0 \quad m_k = \int E^k S(E) dE \quad S(E) = \sum_n |\langle n | F_{\text{monopole}}^{\text{IS}} | 0 \rangle|^2 \delta(E - E_n)$$

$$F_{\text{monopole}}^{\text{IS}} = \sum_{i=1}^A r_i^2$$

The larger K_A , which can be calculated by the EWSR of the GMR, the stiffer is the nucleus !!

Why is tin so soft?

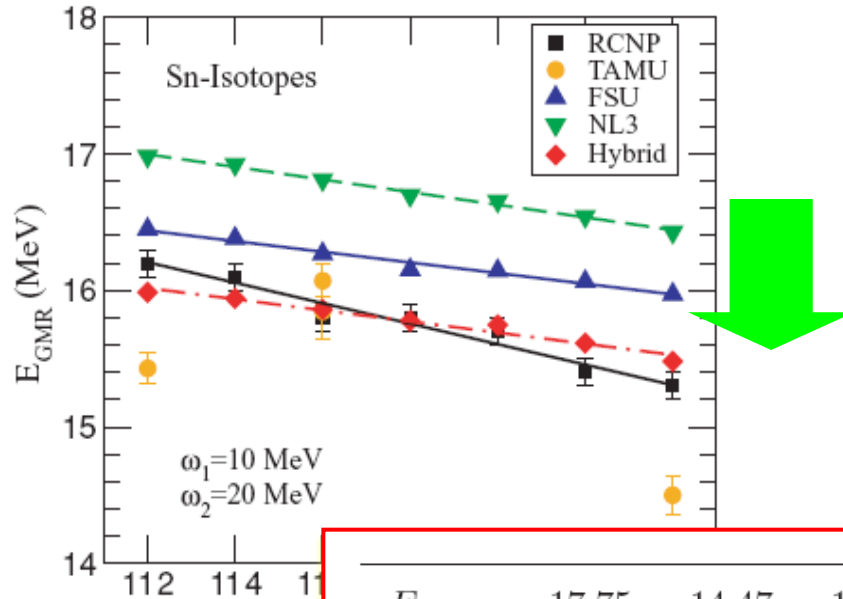

FIG. 8. (Color online) Comparison of the GMR energies (m_1/m_0) in all neutron-even ^{112}Sn - ^{124}Sn isotopes from experiment [6,7] (black solid squares) and the theoretical predictions of the FSUGold (blue up-triangles), NL3 (green down-triangles), and hybrid (red dot-dashed line) models. Also shown (filled gold circles) are experimental data from [30,36,37]

FIG. 7. (Color online) Comparison between the distribution of the isoscalar monopole strength in all neutron-even ^{112}Sn - ^{124}Sn isotopes from experiment (black solid squares) and the theoretical predictions of the FSUGold (blue up-triangles) and the NL3 (green down-triangles) models.

Our results show, the heavier Sn, the softer is the incompressibility !! Detailed microscopic understanding is in progress !!

$$E_{GMR} = \frac{m_1}{m_0} = \frac{1}{\omega_1} - \frac{1}{\omega_2}$$

$$E_{GDR} = 31.2A^{-1/3} + 20.6A^{-1/6} \text{ (MeV)}$$

$$E_{GDR} \approx 80A^{-1/3} \text{ (MeV)}$$

Electric Dipole response in Nuclei

n excess
vs inert core :
oscillation of the
neutron skin

PDR is the resonance between the neutron skin and the symmetric core, in particular, neutron-rich and neutron halo nuclei !!

$$\hat{Q}_{1\mu}^{T=1} = \frac{N}{N+Z} \sum_{p=1}^Z r_p Y_{1\mu} - \frac{Z}{N+Z} \sum_{n=1}^N r_n Y_{1\mu}$$

2.3. Description of CC and NC reactions

Under the second quantization, matrix elements of any transition operator \hat{O}_λ between a ground state and an excited state $|\omega; JM\rangle$ can be factored as follows:

$$\langle QRPA || \hat{O}_\lambda || \omega; JM \rangle = [\lambda]^{-1} \sum_{ab} \langle a || \hat{O}_\lambda || b \rangle \langle QRPA || [c_a^+ \tilde{c}_b]_\lambda || \omega; JM \rangle. \quad (14)$$

Here, the first factor $\langle a || \hat{O}_\lambda || b \rangle$ can be calculated independently of nuclear models for a given single particle basis [29]. Ground and excited states developed in the previous subsection are exploited for the second factor with the quasi boson approximation (QBA). By using the phonon operator $Q_{JM}^{+,m}$ in equation (8), we obtain the following expressions for NC and CC neutrino reactions. For NC reactions,

$$\begin{aligned} \langle QRPA || \hat{O}_\lambda || \omega; JM \rangle = & \sum_{\alpha\alpha' b\beta'} [N_{\alpha\alpha' b\beta'} \langle \alpha\alpha' || \hat{O}_\lambda || b\beta' \rangle [u_{p\alpha\alpha'} v_{pb\beta'} X_{\alpha\alpha' b\beta'} + v_{p\alpha\alpha'} u_{pb\beta'} Y_{\alpha\alpha' b\beta'}] \\ & - (-)^{j_a + j_b + J} \mathcal{N}_{b\beta' \alpha\alpha'} \langle b\beta' || \hat{O}_\lambda || \alpha\alpha' \rangle [u_{pb\beta'} v_{p\alpha\alpha'} X_{\alpha\alpha' b\beta'} + v_{pb\beta'} u_{p\alpha\alpha'} Y_{\alpha\alpha' b\beta'}]] \\ & + (p \rightarrow n), \end{aligned} \quad (15)$$

where the normalization factor is given as $\mathcal{N}_{\alpha\alpha' b\beta'}(J) = \sqrt{1 - \delta_{ab} \delta_{\alpha'\beta'} (-1)^{J+T} / (1 + \delta_{ab} \delta_{\alpha'\beta'})}$.

Without the np pairing correlation, this expression can be easily reduced to the following simple form:

$$\begin{aligned} \langle QRPA || \hat{O}_\lambda || \omega; JM \rangle = & \sum_{ab} [N_{apbp} \langle ap || \hat{O}_\lambda || bp \rangle [u_{pa} v_{pb} X_{apbp} + v_{pa} u_{pb} Y_{apbp}] \\ & - (-)^{j_a + j_b + J} \mathcal{N}_{bpap} \langle bp || \hat{O}_\lambda || ap \rangle [u_{pb} v_{pa} X_{apbp} + v_{pb} u_{pa} Y_{apbp}]] + (p \rightarrow n), \end{aligned} \quad (16)$$

Table. I: Various moments of the IVGDR through the energy weighted sum rule (EWSR),

$$m_k = \int E^k S(E) dE, \text{ with the strength functions of the GDR and PDR}$$

A	PDR		E_c	GDR		E_c	PDR/GDR	
	m_0	m_1		m_0	m_1		m_0 (%)	m_1 (%)
112	0.42	3.05		4.58	93.4		3.26	9.28
114	0.52	3.62		6.16	122.4		2.95	8.50
118	1.61	13.9		12.3	213.6		6.49	13.1
120	1.15	9.86		12.66	226.3		4.35	9.09
122	2.92	26.4		13.61	213.8		12.4	21.4
124	3.29	31.9		14.99	230.8		13.8	23.3

PDR is increased with the heavier Sn isotopes !!

Detailed analysis for the K value are in progress !!

Neutron Star Crust vs ^{208}Pb Neutron Skin

- Neutron star has solid crust (yellow) over liquid core
- Nucleus has neutron skin
- Both neutron star crust and ^{208}Pb neutron skin are made of neutron rich matter at similar densities.
- **Common unknown is EOS at subnuclear densities.**

Parity Violating Electron Scattering could be also the alternative to study the EoS in low density !!

$$A = \frac{\sigma_R - \sigma_L}{\sigma_R + \sigma_L} \propto \frac{\begin{array}{c} \text{e} \text{---} \gamma \text{---} p \text{---} Z \text{---} p \\ \text{e} \text{---} \gamma \text{---} p \end{array}}{\left| \begin{array}{c} \text{e} \text{---} \gamma \text{---} p \end{array} \right|^2}$$

2013-05-24

$$= \left[\frac{-G_F Q^2}{4\pi\alpha\sqrt{2}} \right] \times (\text{form factors}) \approx 10^{-5} \sim 10^{-6}$$

Data from FOPI HIC exp.

Access to $S(\rho)$ at $\rho > \rho_0$?

π^-/π^+ ratio data: Reisdorf *et al*, NPA781(07)459

IBUU04 calculations: Xiao, Li *et al*, PRL102(09)062502

Evidence for a suprasoft $S(\rho)$ at $\rho > \rho_0$??

But, NS may collapse by **the super-soft EOS !!!**
 There is a new analysis.
 One needs more **experimental data !!!**

Physics Reports 464 (2008) 113–281

Bao-An Li^{a,*}, Lie-Wen Chen^b, Che Ming Ko^c

Symmetry energy is still uncertain at high densities !!

And it strongly depends on given models.

$$\mathcal{L}_{int} = -g_8 \sqrt{2} [\alpha \text{Tr}([\bar{B}, M_8] B) + (1 - \alpha) \text{Tr}(\{\bar{B}, M_8\} B)] - g_1 \frac{1}{\sqrt{3}} \text{Tr}(\bar{B} B) \text{Tr}(M_1), \quad (23)$$

FIG. 2. Meson fields in the CQMC model for the same cases as Fig. 1.

RMF + CQMC

FIG. 4. Mass-radius relations in the QMC and CQMC models.

FIG. 3. Equations of state by QMC and CQMC models.

SU(3) extension may lead to massive NS about 2.0 Solar Mass, even with hyperons !! ??

FIG. 2. Particle fractions, Y_i , in the GM1, GM3, NL3 and TM1 models (upper left: GM1, upper right: GM3, lower left: NL3, lower right: TM1).

Eq. of State Results by the MTOV from modified Gravity

$$S = \frac{1}{16\pi} \int d^4x \sqrt{-g} f(R) + S_{\text{matter}} \quad f(R) = R + \alpha h(R) + \mathcal{O}(\alpha^2)$$

Modified TOV

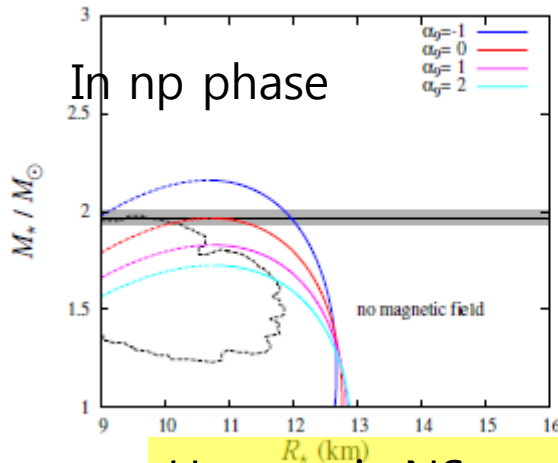

$$\frac{dP_\alpha}{dr} = -(\rho_\alpha + P_\alpha) \frac{d\phi_\alpha}{dr}$$

$$2(r - M_\alpha) \frac{d\phi_\alpha}{dr} = 8\pi r^2 P_\alpha + \frac{M_\alpha}{r} - \alpha h_R \left[\begin{array}{l} 8\pi r^2 P + \frac{r^2}{2} \left(\frac{h}{h_R} - R \right) \\ + (2r - \frac{3}{2}M + 4\pi P r^3) \frac{h'_R}{h_R} \end{array} \right]$$

the parameter α depend heavily on the length scale considered.

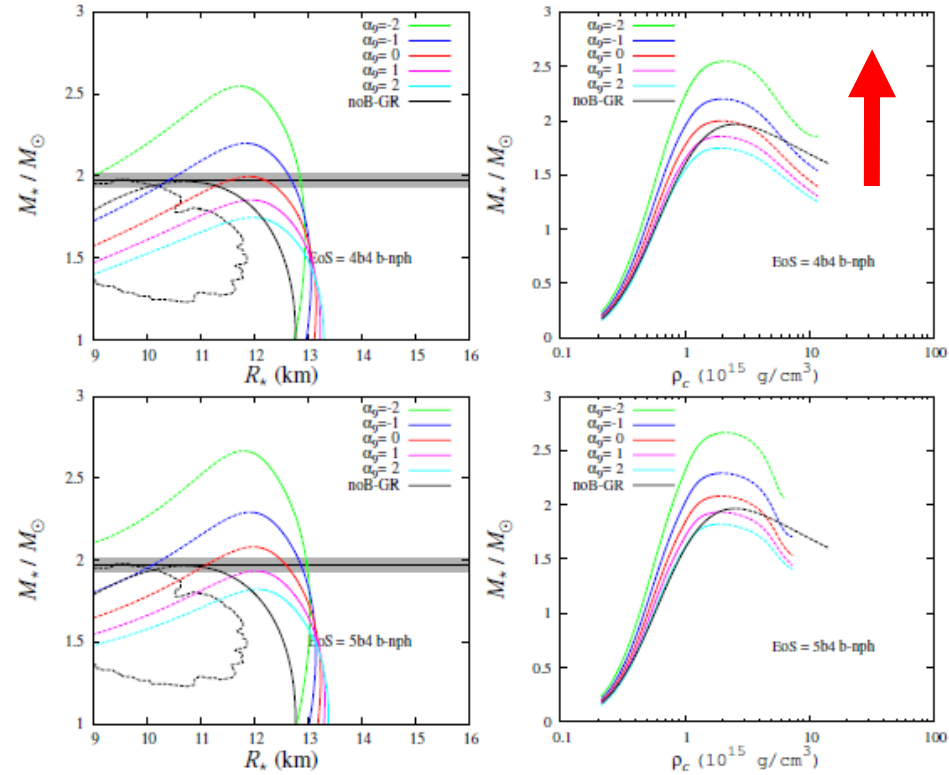

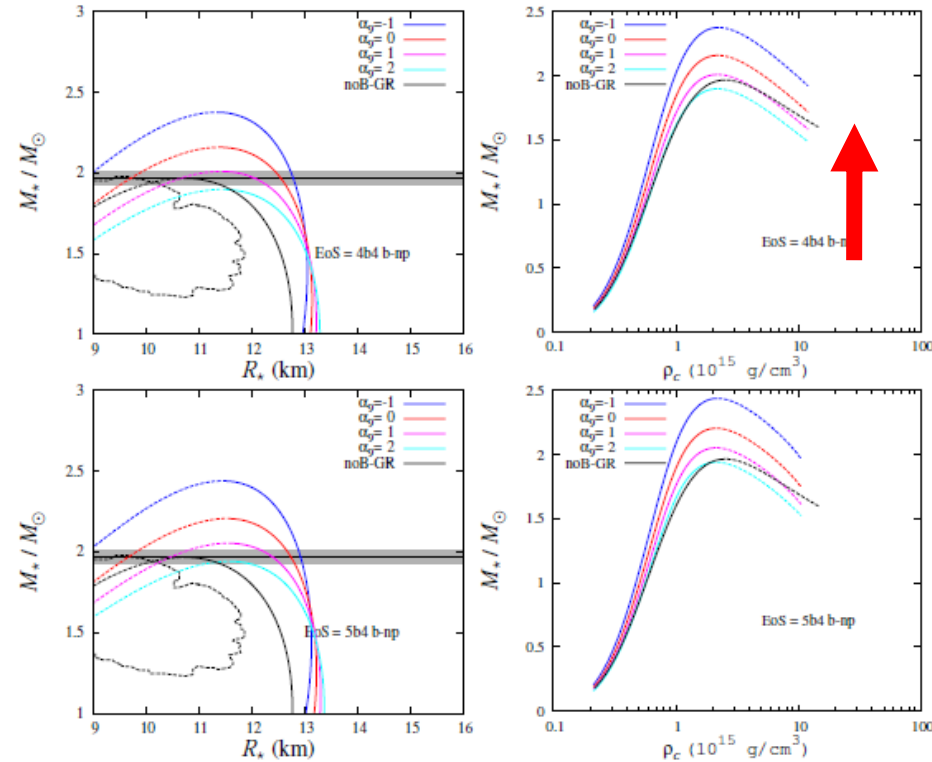

related to the Yukawa correction to the Newtonian potential, $\frac{G}{3} \exp(-r/\lambda) \quad \lambda = \sqrt{6\alpha}$

For alpha = -1(+1), more steeper (softer) EOS and more massive (light) Masses !!

Hyperonic NS may go to 2.0 solar mass by the modified gravity with reasonable magnetic field **without any modification in RMF !!**

In np and nph phase with stronger magnetic field

$\alpha_9 \equiv \alpha/10^9 \text{ cm}^2 = -2, -1, 0, 1, 2$ in the $f(R) = R + \alpha R^2$ gravity.

the Kaluza-Klein action expands into:

$$\mathcal{R} \rightarrow f(R) = R - \alpha|F|^2 ,$$

For **stronger m. field**, we obtain more stiffer EOS and more massive Masses !! May **compensate modified gravity (alpha > 0)**.

If we divide the symmetry energy into kinetic and potential terms as

$$S(\rho)_{\delta=1} = T_{\text{sym}} + V_{\text{sym}}, \quad (18)$$

the kinetic term reads

$$T_{\text{sym}} = \frac{\Delta E_{\text{kin}}}{\rho} = \frac{(k_F^N)^2}{6\sqrt{(k_F^N)^2 + (m_N^*)^2}}, \quad (19)$$

where k_F^N is the Fermi momentum of the nucleon in symmetric nuclear matter. The potential part is then written as

$$V_{\text{sym}} = \frac{\Gamma_{\rho N}^2}{8m_\rho^2} \rho. \quad (20)$$

As mentioned in the Introduction, the polytropic formula of the potential term is written as

$$V_{\text{sym}}(\rho) = \frac{C_{s,p}}{2} \left(\frac{\rho}{\rho_0}\right)^{\gamma_i} \quad (21)$$

where $C_{s,p} = 35.2$ MeV and the symmetry energy at saturation density is $S_0 = 30.1$ MeV in Ref. [1]. Therefore, $\Gamma_{\rho N}$ can be obtained from this formula for given γ_i . In this work, we test $\gamma_i = 0.5, 1$ and 2 .

FIG. 1: (color online). The potential part in symmetry energy.

$$\Gamma_{ib}(\rho) = g_{ib} f_i(n), \quad (12)$$

where $n = \rho/\rho_0$ with ρ_0 the saturation density. It is assumed that $f_i(1) = 1$, so g_{ib} denotes the coupling constant at the saturation density. Density-dependent part $f_i(n)$ is given by

$$f_i(n) = a_i \frac{1 + b_i(n + d_i)^2}{1 + c_i(n + d_i)^2}. \quad (13)$$

Meson(<i>i</i>)	g_{iN}	a_i	b_i	c_i	d_i
σ	10.87854	1.365469	0.226061	0.409704	0.901995
ω	13.29015	1.402488	0.172577	0.344293	0.983955

TABLE I: Parameters of the density-dependent coupling constants of the type Γ_{ib} and Wolter [7] fitted to the saturation density $\rho_0 = 0.153 \text{ fm}^{-3}$, binding energy per nucleon 16.247 MeV, and the compression modulus $K_0 = 240$ MeV. Masses of mesons are used as $m_\sigma = 550$ MeV and $m_\omega = 783$ MeV.

Gamma factors from experiments may be exploited in RMF and predict EoS and MR relations of Neutrons Stars !!

C-Y. Ryu and MKC, submitted for publication

FIG. 3: (color online). The equation of state and mass-radius relation for various γ_i and $B^* = 1 \times 10^4$ for all calculations is used.

FIG. 4: (color online). The equation of state and mass-radius relation for magnetic fields. $\gamma_i = 0.69$ is used.

$\Gamma_{\text{gamma}_i} = 0.69$

Mass-radius relation of neutron stars may depend heavily on the gamma factor in the Symmetry energy !!!

Asymmetry of neutrino emission in SN explosion

$B = 2 \times 10^{17} \text{ G}$. This gives $\mu_N B = 0.63 \text{ MeV}$.

Nuclear Matter \Rightarrow RMF Approach

Different Mean-Field for p, n & Λ

Fermi Motion, Mom.Dep.-Spin Vector, EoS

Neutrino Reactions and Transport by Boltzmann Eq.

Magnetic-Field is treated perturbatively

$$\sigma = \sigma_0 + \Delta\sigma \quad (\Delta\sigma \propto B)$$

Magnetic Field increases neutrinos emitted in the direction parallel to the magnetic field and decreases that in its opposite direction

Summary and Conclusion

1. **Symmetry energy and equations of state for nuclear (finite and infinite) matter systems are one of the main goals in RAON physics.**
2. **Pairing gaps leading to the BCS phase are to be studied in detail for the symmetry energy research.**
3. **For finite nuclei, we tested our nuclear model (QRPA and DQRPA) for GMR and PDR data and deduce the information for the symmetry energy.**
4. **For the information in intermediate density, heavy ion scattering could be vital for the EoS. For high density, observational data of neutrons stars may constrain the EoS. But many ambiguities still remained.**
5. **For a consistent model for finite and infinite matter, we are developing the RMF with the nucleon structure, the pairing, the density dependence and the deformation.**

1S_0 Pairing in uniform matter

$$\mathbb{1} = \mathbb{V} + \mathbb{P} + \dots$$

Gezerlis, Carlson,
Phys. Rev. C 81
(2010)

Lombardo, Schulze,
Lect. Notes Phys. 578
(2001)

Pairing gap equation:

For nuclear matter, RHB equations are:

$$\begin{pmatrix} \epsilon(k) - \lambda & \Delta(k) \\ \Delta(k) & -\epsilon(k) + \lambda \end{pmatrix} \begin{pmatrix} u(k) \\ v(k) \end{pmatrix} = e(k) \begin{pmatrix} u(k) \\ v(k) \end{pmatrix}$$

Where: $\epsilon(k) = V + E^*(k)$ with $E^*(k) = \sqrt{k^2 + m^{*2}}$

$$\lambda = V + \sqrt{k_F^2 + m^{*2}} \quad m^* = m + g_\sigma \sigma$$

$$V = g_\omega \omega_0 + g_\rho \tau_3 \cdot \rho_{0.3}$$

$$e(k) = \sqrt{(\epsilon(k) - \lambda)^2 + \Delta^2(k)}$$

$$v^2(k) = \frac{1}{2} \left(1 - \frac{\epsilon(k) - \lambda}{\sqrt{(\epsilon(k) - \lambda)^2 + \Delta^2(k)}} \right)$$

$$\Delta(k) = -\frac{1}{8\pi^2} \int_0^\infty v_{pp}(k, p) \frac{\Delta(p)}{\sqrt{(\epsilon(p) - \lambda)^2 + \Delta^2(p)}} p^2 dp.$$

Where $v_{nn}(k, p)$ is pairing interaction matrix elements:

$$v_{pp}(k, p) = v_{pp}^\sigma(k, p) + v_{pp}^\omega(k, p) + v_{pp}^\rho(k, p)$$

$$v_{pp}^\sigma(p, x) = \frac{g_\sigma^2}{2E^*(k)E^*(p)} \left\{ \frac{(E^*(p) - E^*(k))^2 + m_\sigma^2 - 4M^{*2}}{4pk} \ln \frac{(k+p)^2 + m_\sigma^2}{(k-p)^2 + m_\sigma^2} - 1 \right\}$$

$$v_{pp}^\omega(p, k) = \frac{g_\omega^2}{E^*(k)E^*(p)} \frac{2E^*(k)E^*(p) - M^{*2}}{2pk} \ln \frac{(k+p)^2 + m_\omega^2}{(k-p)^2 + m_\omega^2},$$

$$v_{pp}^\rho(p, k) = \frac{g_\rho^2}{E^*(k)E^*(p)} \frac{2E^*(k)E^*(p) - M^{*2}}{2pk} \ln \frac{(k+p)^2 + m_\rho^2}{(k-p)^2 + m_\rho^2}.$$

Why the Pygmy Resonance is important ?

There is an extrapolation of 18 orders of magnitude from the neutron radius of a nucleus (from 5-6 fm to 10 km radius) of a neutron star.

Yet both radii depend on the knowledge of equation of state of neutron rich matter.

From the pygmy dipole resonance

One can derive:

- ❑ Nuclear symmetry energy

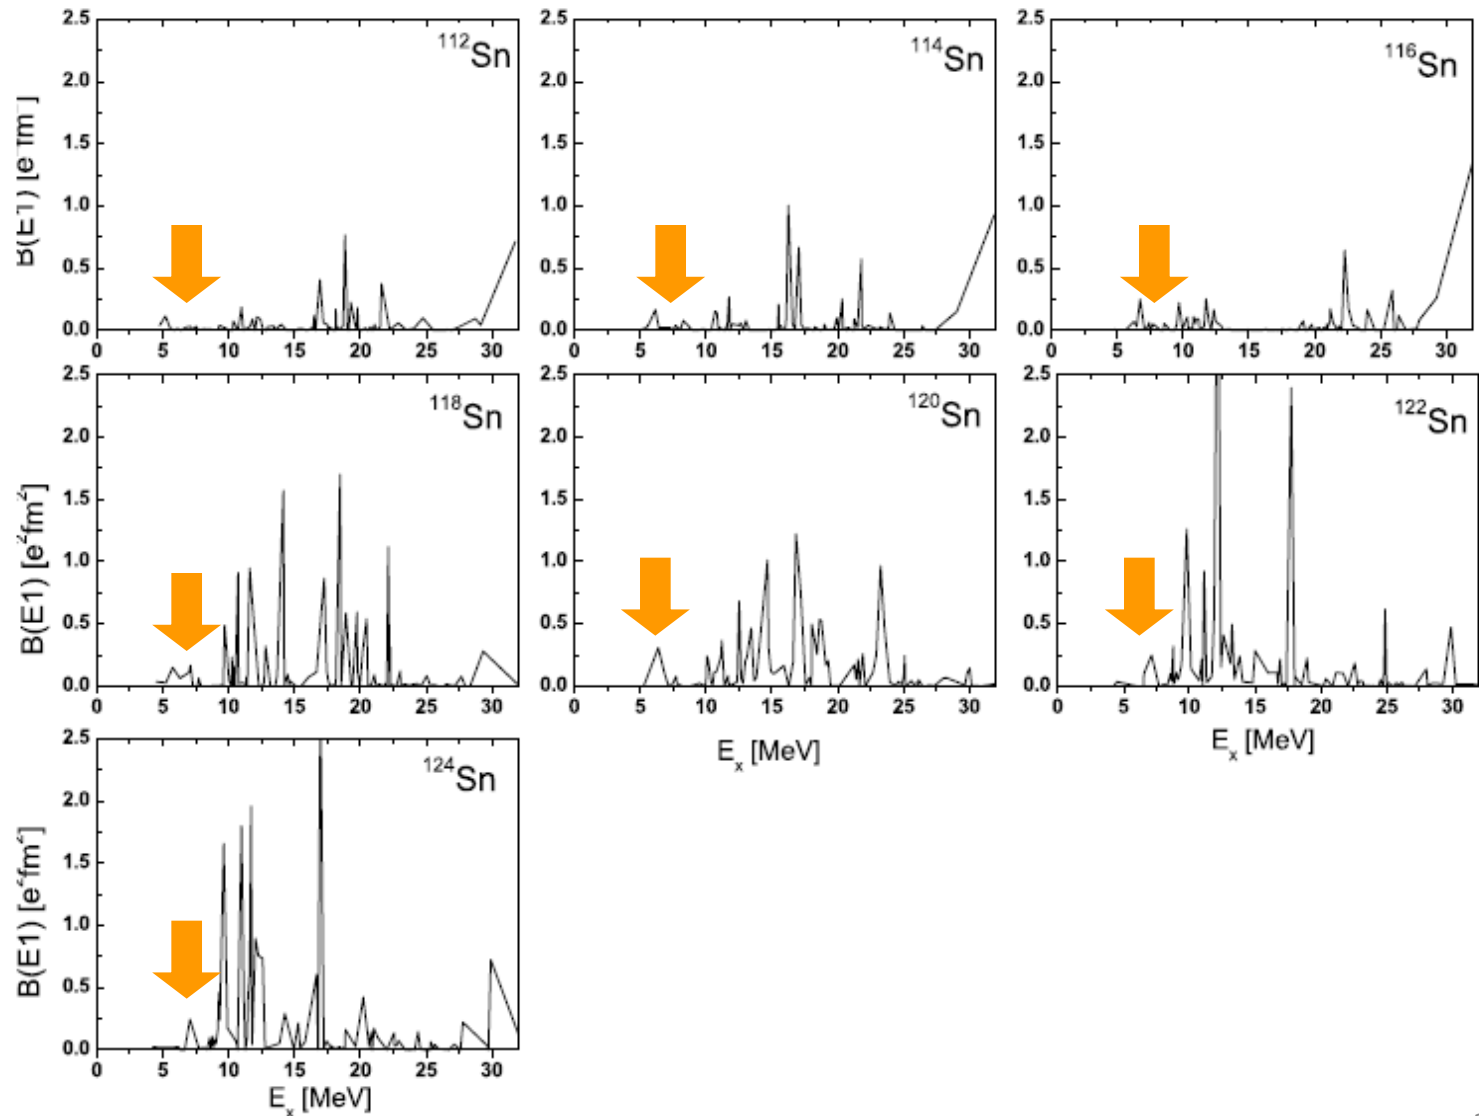

- ❑ Neutron skin

Data on neutron rms radius constrain the isospin-asymmetric part of the Equation of state of nuclear matter

- ❑ Relation between neutron skin and neutron stars :

both are built on neutron rich nuclear matter so that one-to-one correlations can be drawn

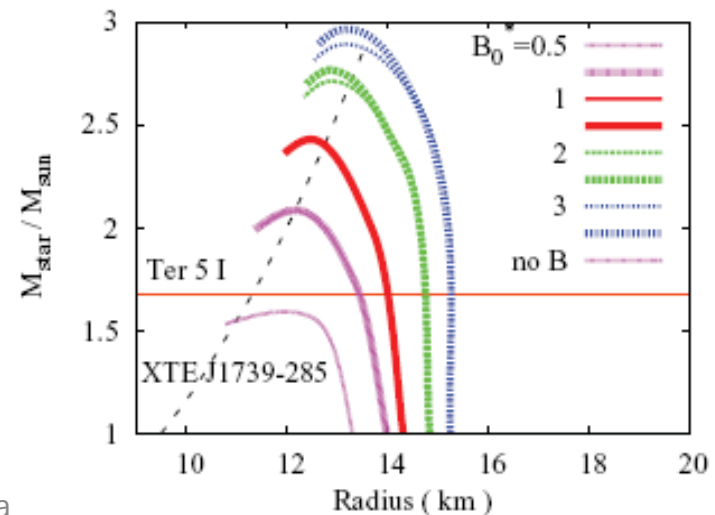

FIG. 2. (Color online) Symmetry energy (upper panel), binding energy per nucleon of symmetric nuclear matter (central panel), and pressure of symmetric matter (lower panel), employing different interactions. The shaded region indicates the constraints of Ref. [28].

PHYSICAL REVIEW C 82, 025804 (2010)

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu} R + g_{\mu\nu} \Lambda = \frac{8\pi G}{c^4} T_{\mu\nu}$$

The current accelerated expansion of the universe

Although the cosmological constant is arguably the simplest explanation and the best fit to all observational data, its theoretical value predicted by quantum field theory is many orders of magnitude greater than the value to explain the current acceleration of the universe. This

categories, both of them introducing new degrees of freedom [9]: The first approach is to add some unknown energy-momentum component to the right hand side of Einstein's equations with an equation of state $p/\rho \approx -1$, dubbed *dark energy*. In the more radical second

approach, the idea is to modify the left hand side of Einstein's equations, so-called *modified gravity*. Trying to explain such perplexing observations by modifying gravity rather than postulating an unknown dark energy has been an active research area in the last few years and in this paper we adopt this path.

Modified TOV equations of $f(R)$ gravity

$$\alpha \lesssim 5 \times 10^{15} \text{ cm}^2$$

$$S = \frac{1}{16\pi} \int d^4x \sqrt{-g} f(R) + S_{\text{matter}}$$

$$f(R) = R + \alpha h(R) + \mathcal{O}(\alpha^2)$$

How will be the modified gravity effect in the stellar scale ???

Motivation 2-1 : Yukawa Potential + Newtonian Gravity

We investigate the nonrelativistic limit by taking the $\mathcal{O}(1)$ part of Eq. (45). Considering each particle as a test particle in the field of the other ones, we replace the potentials U and W by their self-energy free parts. The equations of motion for the test particle then read

$$\frac{dv_n^i}{dt} = G \sum_{k \neq n} \frac{\partial}{\partial x_n^i} \left(\frac{m_k}{|\mathbf{x}_n - \mathbf{x}_k|} \left(1 + \frac{1}{3} e^{-\alpha |\mathbf{x}_n - \mathbf{x}_k|} \right) \right). \quad (49)$$

$\alpha^2 := 1/(6a)$

This is the analogue of the Newtonian equations of motion for a purely gravitating set of point particles.

PHYSICAL REVIEW D 81, 104003 (2010)
 On the $1/c$ expansion of $f(R)$ gravity
 Joachim Näf* and Philippe Jetzer

$$f(R) = -2\Lambda + R + aR^2, \quad a \neq 0,$$

While the laboratory bound from the Eöt-Wash experiment provides the small bound $a \lesssim 10^{-10} \text{ m}^2$, the results from Gravity Probe B imply the much larger limit $a \lesssim 5 \times 10^{11} \text{ m}^2$. The measurements of the precession of the pulsar B in the PSR J0737-3039 system provide instead the limit $a \lesssim 2.3 \times 10^{15} \text{ m}^2$. Even for these large values of a the quadratic term in (5) still induces a small correction of

Theoretical Frameworks 1 : Standard TOV

Standard TOV

$$\frac{dP(r)}{dr} = -\frac{G}{r^2} \left[\rho(r) + \frac{P(r)}{c^2} \right] \left[M(r) + 4\pi r^3 \frac{P(r)}{c^2} \right] \left[1 - \frac{2GM(r)}{c^2 r} \right]^{-1}$$

If $1/c^2$ terms go to 0,
Newtonian Gravity

Solution of the Einstein eq. for a given time independent and spherical symmetric metric

$$ds^2 = e^{\nu(r)} c^2 dt^2 - (1 - 2GM(r)/rc^2)^{-1} dr^2 - r^2(d\theta^2 + \sin^2 \theta d\phi^2)$$

$$\frac{d\nu(r)}{dr} = - \left(\frac{2}{P(r) + \rho(r)c^2} \right) \frac{dP(r)}{dr}$$

With a boundary conditions on a boundary and continuous metric

$$\exp[\nu(r)] = 1 - 2GM(r)/rc^2$$

$$ds^2 = (1 - 2GM_0/rc^2) c^2 dt^2 - (1 - 2GM_0/rc^2)^{-1} dr^2 - r^2(d\theta^2 + \sin^2 \theta d\phi^2)$$

$$\frac{8\pi G}{c^4} T_{11} = G_{11}$$

Theoretical Frameworks 2: Modified TOV by M. Gravity

Modified Action

$$S = \frac{1}{16\pi} \int d^4x \sqrt{-g} f(R) + S_{\text{matter}} \quad f(R) = R + \alpha h(R) + \mathcal{O}(\alpha^2)$$

Modified E. Equation

$$(1 + \alpha h_R)G_{\mu\nu} - \frac{1}{2}\alpha(h - h_R R)g_{\mu\nu} - \alpha(\nabla_\mu \nabla_\nu - g_{\mu\nu} \square)h_R = 8\pi T_{\mu\nu}$$

$$G_{\mu\nu} = R_{\mu\nu} - \frac{1}{2}Rg_{\mu\nu} \quad h_R = \frac{dh}{dR}$$

$$ds^2 = -e^{2\phi_\alpha} dt^2 + e^{2\lambda_\alpha} dr^2 + r^2(d\theta^2 + \sin^2 \theta d\phi^2).$$

$$\phi_\alpha = \phi + \alpha\phi_1 + \dots \quad \lambda_\alpha = \lambda + \alpha\lambda_1 + \dots \quad M_\alpha = M + \alpha M_1 + \dots$$

$$\rho_\alpha = \rho + \alpha\rho_1 + \dots \quad P_\alpha = P + \alpha P_1 + \dots$$

Modified TOV

If alpha dep. terms go to 0,
Standard Gravity

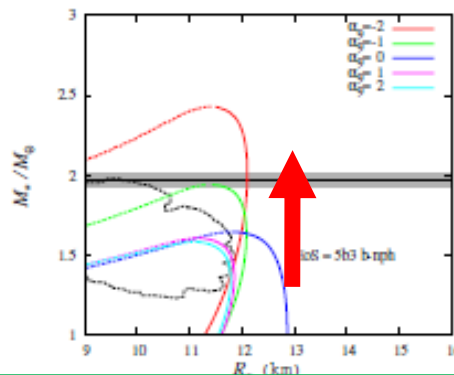

$$\frac{dP_\alpha}{dr} = -(\rho_\alpha + P_\alpha) \frac{d\phi_\alpha}{dr}.$$

$$2(r - M_\alpha) \frac{d\phi_\alpha}{dr} = 8\pi r^2 P_\alpha + \frac{M_\alpha}{r} - \alpha h_R \left[8\pi r^2 P + \frac{r^2}{2} \left(\frac{h}{h_R} - R \right) + \left(2r - \frac{3}{2}M + 4\pi P r^3 \right) \frac{h'_R}{h_R} \right]$$

Hyperonic NS may go to 2.0 solar mass by the modified gravity with reasonable magnetic field without any modification in RMF !!

In nph phase

For $\alpha = -1$ and stronger m. field, more steeper EOS and more massive Masses !!

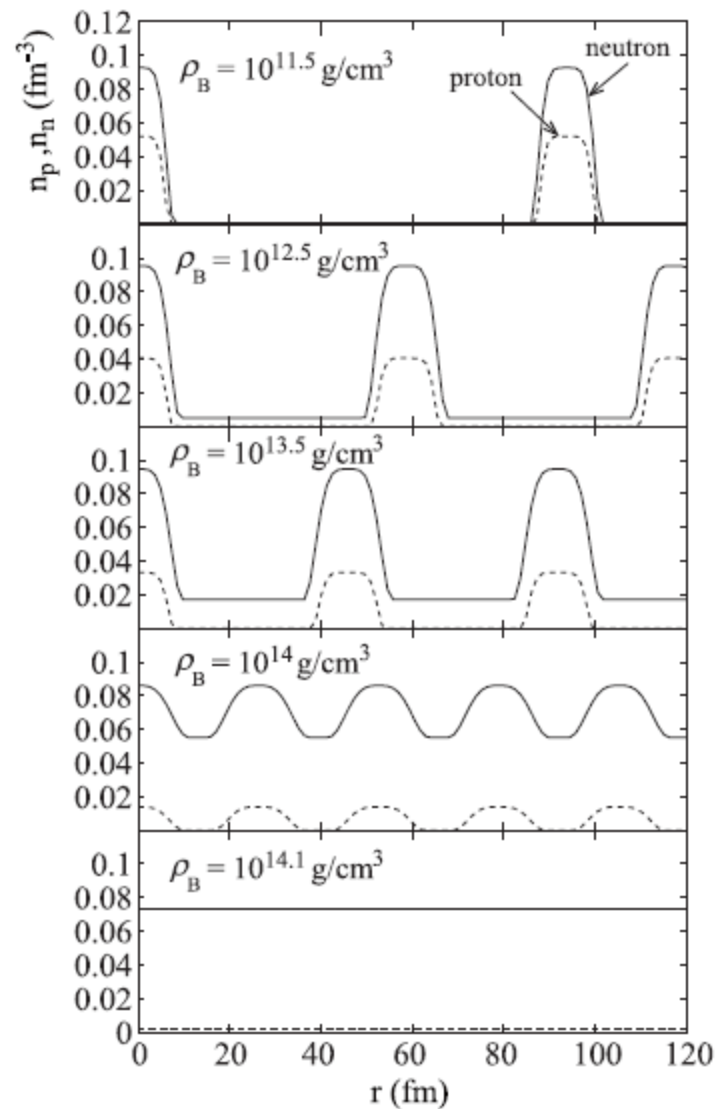

FIG. 3: The neutron distribution (solid) and proton distribution (dashed) along the straight line joining the centers of the nearest nuclei in the bcc lattice. The plots correspond, from top to bottom, to the cases at the baryon mass density $\rho_B = 10^{11.5}, 10^{12.5}, 10^{13.5}, 10^{14.0}$ and $10^{14.1} \text{ g cm}^{-3}$ ($n_B = 1.90 \times 10^{-4}, 1.90 \times 10^{-3}, 1.90 \times 10^{-2}, 6.02 \times 10^{-2}, 7.58 \times 10^{-2} \text{ fm}^{-3}$ in baryon number
